

JUST VERTICAL USER MANUAL

The EVE

The Ultimate Grower's Guide

Welcome to the food revolution! You are embarking on a journey towards a healthier and happier home. We are so glad that you could join us.

The important changes the world needs only happen because of people like you. This guide has everything you need to successfully grow with the EVE.

We believe in our product and have backed it with a 2-year warranty. For your safety, read and understand all instructions prior to installing or turning on your garden. Failure to follow setup instructions or maintenance could lead to damages, injury, or fire.

If there are any missing parts, send us an email at support@justvertical.com and let us know which parts are missing so we can get you growing. We are always available if you have any questions, or concerns. You can also access our live chat on the web at: www.justvertical.com

Getting Started

Setting up the EVE is very simple and, thanks to a little bit of work on our end, you'll need just a few minutes once it arrives to get growing. We've kept it quick for you because you have better things to do (like tasting our 10 different kinds of kale!).

Get To Know Your EVE

What's Included With Your EVE

x1

Seed Starting Kit

x60

Peat Moss Plugs

x8

Starter Seeds

x2

Nutrient Bottles

x1

Wall Mount

x1

Pump Assembly

x12

Plant Pots

x4

EVE Feet

x16

Feet Screws

x1

Light Timer

TIP

Do You Have Different Parts?

Do you have an older version of our garden with different parts, including a different timer? Reach out to support@justvertical.com for guides on the operation of older Just Vertical parts.

Adding The Feet To Your EVE

1 Prepare Your Space

Lay down the EVE either on the cardboard packaging or on a carpet or rug.

2 Insert Screws

Align holes on the feet with the holes on cabinet. Insert all the screws 3/4's of the way. Do not tighten the screws all the way.

3 Align & Tighten

Adjust the legs so they are flush with the cabinet edges. Tighten the two outer screws first. Tighten the remaining inner screws.

4 Repeat & Lift

Repeat the same process for the 3 other feet. Once complete, return the EVE to an upright position.

Mounting Your EVE To The Wall

1 Find A Wall

Locate a place within your house where you think the EVE will stand out!

2 Attach Mount To Unit

Attach the 3M unit attachment to the top of your garden.

3 Attach Mount To Wall

Attach the 3M wall attachment to your desired location on the wall.

4 Connect

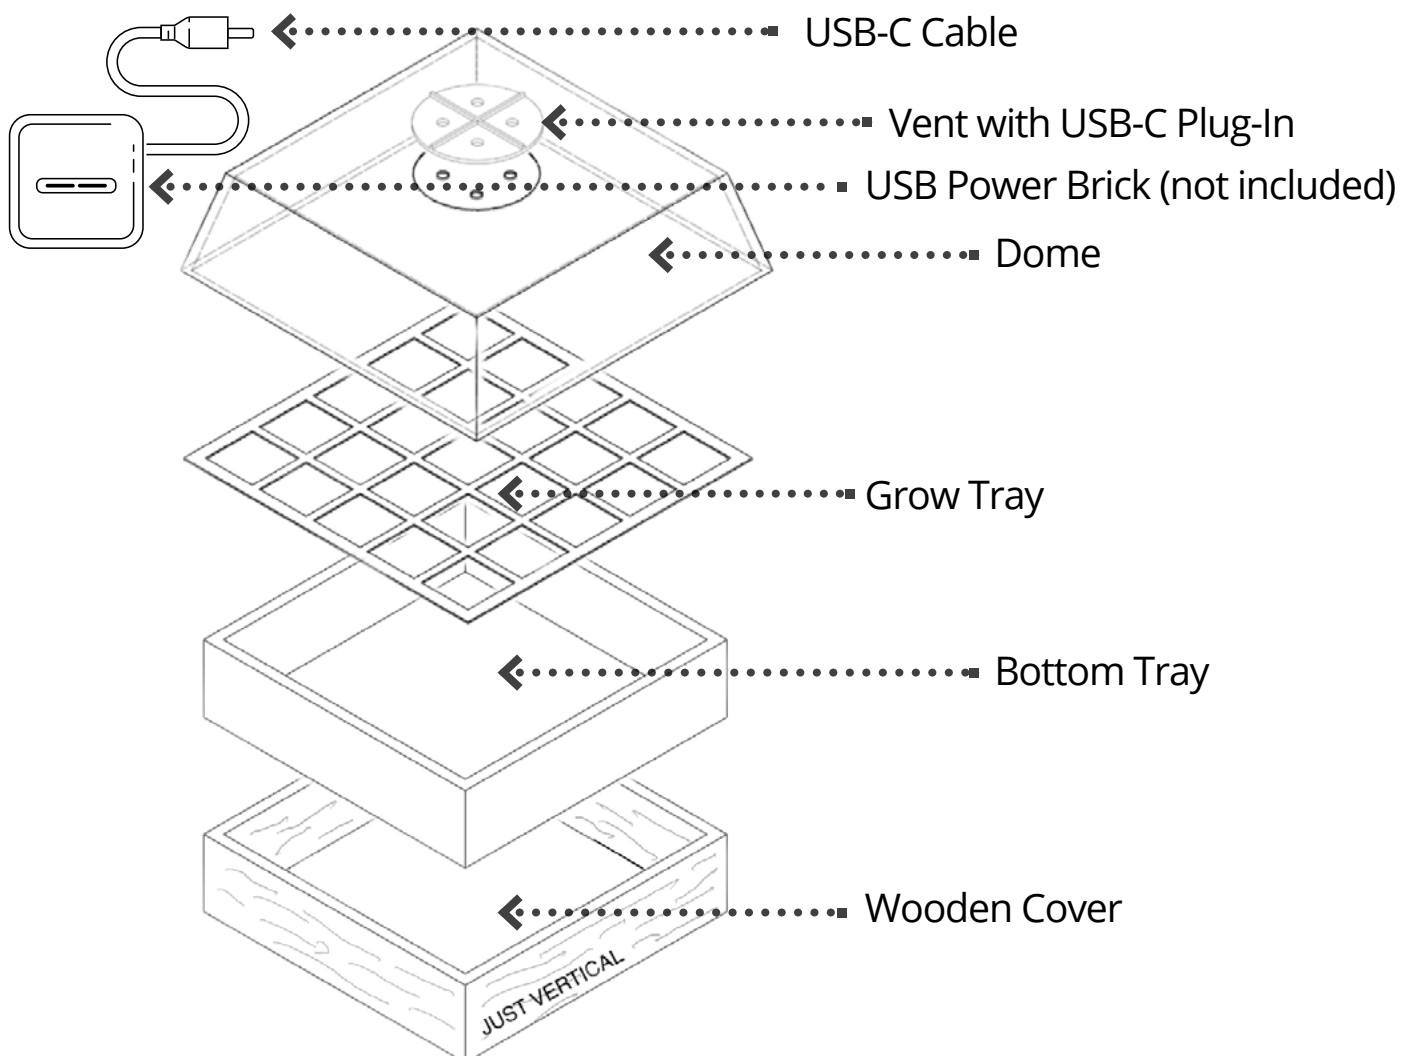

Connect the wall mounts to ensure your garden doesn't move in place.

Planting Seeds

When you order seeds from Just Vertical you are getting the guarantee of seeds that we have tested ourselves. If any of our seeds don't germinate within 21 days, we will provide you a refund on the seeds that don't germinate! Seeds are a living thing and sometimes they just don't germinate, so don't worry if a few don't come out right away. We always recommend you plant a few extra plugs so you can choose the strongest for your garden.

You will use your seed starting kit to start your seeds.

How To Use Your Seed Starting Kit

1

Insert Seeds

Take 14 peat moss plugs (2 extra in case all seeds don't germinate). Place in 1-2 seeds per peat moss plug.

2

Place Plugs

Put the 16 peat moss plugs into the black grow tray.

3

Fill Tray

Fill bottom tray halfway with cold water.

4

Insert Grow Tray

Place the black grow tray with the peat moss plugs inserted into the water.

How To Use Your Seed Starting Kit (continued)

5

Spray Dome

Spray the inside of the dome with warm water and place on top. Keep vents open.

6

Turn On The Light

Insert smaller end of USB-C cord onto top of dome and larger end into a USB Power Brick. Plug into wall and keep on 24/7.

7

Wait & Grow

Soak plugs with water for 15 minutes each day. Move plugs around tray regularly to avoid plants leaning towards the light.

8

Start Transplanting

Once plants are touching the top of the dome, they are ready to be transplanted.

How To Use Your Seed Starting Kit (continued)

9

Remove Seedlings

Push out seedlings from bottom opening in the grow grid with a sharp object (like a chopstick or pencil).

10

Place Into Unit

Place seedlings into the plant pot in your garden.

TIP

How To Grow Great Seedlings

Any new plant is looking for three things: light, water, and nutrients. To give your seedlings the best chance to grow, you need to help them achieve the first two things in particular.

To optimize the amount of light each plant gets before you transplant, ensure that you rotate your seedlings with the grow tray so they don't lean towards the light.

To ensure your plants don't get too much water (and, as a result, grow leggy), remove any excess water in your grow tray once the peat moss plugs are soaked.

Pump Setup & Preparing Your Reservoir

1

Locate Cords

Locate the quick connect cords. These will be found inside your cabinet.

2

Connect Cords

Connect the quick connect cords. These should immediately snap into place.

3

Drain Hose Check

Make sure your drain hose is placed inside the reservoir as shown in the image.

4

Plug In Pump

Locate an outlet or power bar. Plug in your pump. The pump will run automatically when the entire unit is powered on.

Filling Your Reservoir & Reservoir Levels

Filling Your Reservoir For The First Time

The reservoir is designed to stay in your unit. Avoid removing the reservoir from the cabinet when filling it with fresh water.

To fill the reservoir, simply transfer water into the tank through the open hole at the top of the reservoir while it's in the unit. The simplest way to fill up your reservoir is with a watering can.

Reservoir Levels

1

Full Reservoir

Your reservoir is full. This tank of water will last up to 2 weeks, dependent on plant size. Check water levels weekly.

2

Half-Full Reservoir

Half-full reservoir. This tank of water will last up to 1 week, dependent on plant size.

3

Empty Reservoir

Reservoir is empty. This tank of water needs to be refilled to the original fill line.

TIP

How Long Does Your Pump Run?

Once you turn your pump on, you'll notice the pump runs automatically. Our pumps are on an automatic timer that runs for 1 minute every 30 minutes.

Nutrients

Using nutrients is an easy process. With a fresh reservoir with new water in it, add 25mL of Vega A and Vega B. If you have previously added nutrients to the same water within your reservoir, add 15mL of Vega A and Vega B to top up the reservoir.

Adding Nutrients

25mL

1

New Tank Of Water

On every new tank of water, add 25mL of Vega A and 25mL of Vega B nutrients.

15mL

2

Used Tank Of Water

After every 2 weeks inside the EVE, add 15mL of Vega A and 15mL of Vega B.

TIP

Growing Flowering Plants?

If you are growing flowering plants such as tomatoes or strawberries, once the flowers start to bloom, you will start with a fresh reservoir and add 30ml of Flores A and 30ml of Flores B. You will then add 15ml of Flores A and 15ml of Flores B every two weeks.

Turning On Your EVE

1

Find A Power Outlet

Find a standard power outlet to plug in your power bar.

2

Connect Cords

Connect the pump cord and light cords to the plugged-in power bar.

3

Power On

Once the cords are connected, the power is now connected.

FUN FACT

Power Supply

To operate, the EVE can use any standard 120-volt, 3 prong electrical outlet. The EVE uses \$3.56 CAD a month in electricity. This equates to 0.072 kW / per hour.

Setting Your Timer For Lights

1 Power

Plug the power cord from your timer into a power outlet. The red light at the bottom will turn red. This means the light is OFF.

2 Turn Light On

Press the  button. This will turn your light ON. At this current setting, your light is on for 24 hours.

Device will turn on when you press the button.

Device will turn off automatically 18 hours from when you press the button.

3 Set Your Light Cycle

Press the 3rd clock button for 18 hours on, 6 hours off. A red light should shine above 18h on the timer.

TIP

How The Light Timer Works

Your timer will set **from when you press the clock button**. For example, if you set the timer at '18 hours' at 9am, your light will be on between 9am - 3am (18 hours) and off between 3am - 9am (6 hours). At 9am the next day (24 hours later) the cycle will reset.

Also note that the timer may fall out of a 24 hour schedule. Reset the timer by removing and replacing it into your power outlet if this occurs.

Maintenance

Maintaining your EVE is extremely important. Within this section of our guide, you'll find all the tasks you need to complete throughout your growth lifecycle. With some (very minimal) easy-work, your garden will be happy, bright, and full of life across it's entire growing journey.

8 Week Maintenance Schedule

Complete each maintenance task at the frequency stated below to ensure your unit operates at peak performance and to maximize plant health and growth. The cycle repeats every 8 weeks. Browse the following pages to find instructions on how to complete each task specifically. After every 6 months of growing, please clean the inside of your garden with our Hydrogen Peroxide Kit. Please consult the instructions in the Troubleshooting section on how to clean the inside of your garden.

GROWING RESOURCE

Maintenance Calendar

Week #	1	2	3	4	5	6	7	8
Maintain Plants								
Check Reservoir								
Check & Trim Roots								
Add Nutrients								
Clean Reservoir								

Maintain Plants

1 Checking For Dying Plants

It is common for leaves on plants to die as the plant continues to grow within your garden. Each week, search and pick off any yellowing leaves from your plants.

2 Harvesting

Harvesting is essential for your plants' growth. Harvest consistently when your plants are ready to eat. You can find more information about harvesting in our section below titled 'Harvesting' on Page 27.

3 Plug Positioning

Ensuring your plants are positioned correctly in the plant pots can make the difference between small and large growth.

Make sure all the peat moss plugs are pushed all the way down into the plant pot, as shown in the images to the left.

Checking The Reservoir

Check your water levels and top up on a weekly basis or as needed. Only add nutrients every 2 weeks (as indicated in the nutrients section of the manual).

Friendly reminder: even if you added additional water, that does not mean you need to add nutrients as well.

1

Full Reservoir

Your reservoir is full. This tank of water will last up to 2 weeks, dependent on plant size. Check water levels weekly.

2

Half-Full Reservoir

Half-full reservoir. This tank of water will last up to 1 week, dependent on plant size.

3

Empty Reservoir

Reservoir is empty. This tank of water needs to be refilled to the original fill line.

Adding Nutrients

If you have a fresh reservoir with new water in it, add 25mL of Vega A and Vega B. If you have previously added nutrients to the same water within your reservoir, add 15mL of Vega A and Vega B to top up the reservoir.

We made measuring easy - 1 capful of your nutrient bottle is equal to 10mL.

Trimming Roots

Trimming the roots in your garden is one of the most important tasks you can do. Once you get the hang of removing the plants from their plant sites, the task will only take you about 5 minutes each week.

By trimming the roots of all the plants, it allows proper water flow throughout the unit and reduces any chances of leaks.

1

Check Your Garden

Check your roots weekly. If your roots are longer 3" (below or on the side of the pot), move to the next step.

2

Trim The Bottom

Remove all the roots at the bottom of the pot so they are less than 3".

3

Trim The Sides

Remove all the roots at the sides of the pots, ideally all the way to the surface of the plant pots.

Cleaning The Unit

1

Reservoir

Wipe off any accumulation of debris or salt buildup on the inside of the reservoir.

2

Front Face

Wipe off any debris, splashed water, or nutrient runoff weekly to maintain the visual appeal of your unit.

TIP

Salt Stains

If you notice there are reoccurring salt stains on the front face of your unit, check the roots of the plants. If the roots are longer than 3 inches, they will cause a small leak in your unit.

Harvesting

Now the fun begins. Harvesting is one of the most gratifying and fulfilling activities of operating your indoor garden. Read on to find handy tips on how to harvest and some common tips on harvesting some more popular varieties of plants.

Getting Started With Harvesting

When harvesting there are three rules to follow:

1

Harvest Volume

Do not take more than 1/3 of the plant at once as it can shock and kill the plant. Be careful when harvesting to not harvest too much.

2

Plant Stem Behaviour

If the main stem is going 'woody' then the plant is bolting and it is time to harvest the plant in full and replace it with a new plant.

3

Plant Flowering Behaviour

If your plant is growing flowers, the plant has come to the end of its life, so it is time to harvest and replace it with a new plant.

TIP

How Much Can I Grow?

You can expect 3.75-7.5 lbs (1.5-3 kg) in the EVE after the first month of growth. That equals to approximately 25 servings in the EVE of fresh produce each month.

Harvesting Tips For Specific Plants

1 Arugula

Ready to harvest 3-4 weeks after germination. You can harvest continually by taking only a few leaves at a time from the outside, or taking the whole plant at once.

2 Lettuce

Ready to harvest 3-4 weeks after germination. You can harvest continually by taking only a few leaves at a time from the outside, or taking the whole plant at once.

3 Kale

Ready to harvest 3-4 weeks after germination. Harvest by taking individual leaves, starting with a particular focus on taking the leaves closer to the base of the plant.

4 Parsley

Ready to harvest 2-3 weeks after germination. Should be regularly pruned as it grows. To harvest cut the stalks from outside in and as close to the base of the plant.

Harvesting Tips For Specific Plants (continued)

5

Basil

Ready to harvest 2-3 weeks after germination. Harvested many times throughout its life and responds well to being trimmed. Cut basil from the top canopy of the plant to encourage fuller growth.

6

Mint

Ready to harvest 2-3 weeks after germination. Tends to get fresher the more it is harvested. Continually harvest once it is 3 or more inches long. Trim it from the base making sure to leave it about 2 inches of growth.

7

Cilantro

(also known as coriander) Ready to harvest when it is 6 inches tall or after 2-3 weeks after germination. To harvest just pick off what you need or cut off a bunch at once. Enjoy the fresh tacos!

9

Dill

Ready to harvest 2-3 weeks after germination. Takes around 8 weeks to fully develop. should be regularly pruned as it grows. To harvest cut the stalks from the outside in and as close to the base of the plant.

Troubleshooting – Hardware

Despite our best efforts, sometimes things can still go wrong with your unit. Don't fret. Here are some frequently used troubleshooting steps that will help you get your unit back to running in no time.

If you find that our troubleshooting section will not resolve your issue, you can reach out to support@justvertical.com to get your specific issues resolved.

Water Not Being Delivered To Plants

Follow below to rectify any issues related to water not being delivered to plants.

1 Pump Position

Is the water in the reservoir covering the pump while it's running?

2 Pump Connection

Is the pump plugged into the power bar or an outlet?

3 Quick Connect Connection

Are the black quick connect power cables for the pump and its timer properly connected to each other?

4 Power

Check there is power to the outlet in your home.

5 Reset

Try turning the system off for 5 minutes and then turning it back on.

6 Supply Line

Check that the supply line is connected to the pump.

Leaking From The Pots Onto Front Face

This can be noticed by salt stains (white streaks) on the front face of the unit. This is caused by two main things:

- Large plants
- Plants with a large root mass

To solve this problem, ensure you are regularly trimming the roots on your plants. Trimming your roots on a regular basis not only avoids the garden from leaking, but also helps you grow healthier plants with more nutritional content.

Learn more about trimming your roots in the 'Maintenance' section of this manual.

TIP

Rapunzel Roots

Longer roots as well as “rapunzel-like” roots will cause a leak in your EVE. Make sure you maintain the roots in the EVE.

Leaking From The Bottom Plant Site

This issue is caused by a very large root mass in the bottom plant sites of the unit, or any debris that may have found its way into the unit. When roots or debris block water flow back into the drain, the water will be forced out from the bottom plant pot. If after trimming the roots the drain is still blocked, proceed to the blockage in the supply line or drain troubleshooting.

1

Root Maintenance

Do not allow the roots to grow into the drain. Trim your roots at least once a month. See our section in 'Maintenance' on root trimming.

Water Is Leaking From An Inside Pipe

On occasion, you may notice water leaking from an unidentified pipe. Follow these steps to rectify the issue.

1

Supply Line

Check the supply line (clear tubing) is securely in the tee.

2

Reservoir

Check that the reservoir is directly underneath the black drain pipe.

Plants Not Receiving Enough Water

The EVE is designed to water all plants evenly. However, sometimes certain plants can get more water than others. This could be caused by the two reasons below.

1 Timer

The timer is not running as long as it should.

2 Supply Line And/Or Drain

There is a blockage in the supply line or drain.

These issues can easily be resolved. The pump can be manually run by removing the timer box and plugging the pump directly into the power bar. Let the pump run for several minutes and observe whether the plants are now getting enough water in which case the timer box may be defective or there may be a blockage in the drain.

Blockage In The Supply Line Or Drain

Please note that H2O2 mentioned in Step 5 is sold separately. You can find it on our store here: [H2O2 Cleaner](#)

1

Quick Grab

Remove the bottom plant pot and utilize the quick grab tool to grab roots that may be stuck in the drain and other debris.

2

Plant Removal

Remove ALL your plants from your unit and place the plants in a container filled with cold water.

3

Empty Reservoir

Empty the reservoir. You can save the nutrient water in another container for re-use or pour it down the sink.

4

Refill Reservoir

Fill the now empty reservoir with warm water.

Blockage In The Supply Line Or Drain (continued)

5

Hydrogen Peroxide

Add the amount of Hydrogen Peroxide (sold separately) recommended on the bottle to your now filled reservoir.

6

Re-Insert Reservoir

Make sure the drain is directly above the reservoir to allow your EVE to flush properly.

7

Run Pump

Allow the pump to run continuously for 15-20 minutes. To let the pump run, disconnect the black box from the pump.

8

Pump & Reservoir

Unplug the pump and reconnect the black box. Rinse out reservoir and pump.

Blockage In The Supply Line Or Drain (continued)

1

Replace Materials

Return the nutrient water back into the reservoir and the plant pots back in the EVE.

2

Completion

Plug the pump back into the power cord and you have now completed the descaling process.

FUN FACT

What Is Hydroponics?

By definition, hydroponics means “working with water.” It is the method of growing plants both indoors and outdoors without soil, using mineral nutrient solutions in a water solvent.

Troubleshooting – Plants

Are your plants growing slower than expected? There could be one or more issues affecting this. First make sure your expectations are reasonable and in line with what plants are capable of (our system is amazing but not a miracle worker).

In the next few pages you'll find the most common issues we find with plant care.

Nutrient Deficiency/Saturation

Having too high a concentration of nutrients in your reservoir can cause tip burn on your plants. This is exhibited by browning or yellowing of the leaves. It could also cause wilting or weakening of the plant. If a large quantity of nutrients were accidentally added to your reservoir it is recommended that you empty your reservoir and add fresh nutrients.

Nutrient deficiencies can be indicated by poor plant health. Indicators of these could be plant wilting, yellowing of leaves, browning of leaves, etc. Please refer to the nutrient section for correct dosing.

Temperature

If your plants are exposed to extremely hot or cold air (under heating vent or next to a door in the winter) this could be stunting plant growth.

Air Flow

If your plants are not getting any air flow this can also stunt plant growth, ensure there is adequate air flow around your plants.

PH Levels

If you are running your EVE on well water or otherwise irregular water test the pH level of the water source. A pH outside of the normal range could negatively affect your plant growth. Heavy metals in the water can especially can stunt plant growth.

TIP

Speak To Support

Have you got any specific troubleshooting questions not covered in the manual?

We have a dedicated support team that you can reach to discuss any and every problem you have. Simply email support@justvertical.com to contact our support team.

Thank You!
We look forward to
growing with you.
